

SHORT REPORT

Open Access

Targeting of Acyl-CoA synthetase 5 decreases jejunal fatty acid activation with no effect on dietary long-chain fatty acid absorption

Nahum Meller, Michelle E Morgan, Winifred PS Wong, Jessica B Altemus and Ephraim Sehayek*

Abstract

Background: The absorption of dietary long chain fatty acids (LCFA) largely occurs in the jejunum. LCFA are activated via conjugation with Coenzyme A (CoA), a reaction catalyzed by Acyl-CoA synthetases (ACS). Acyl-CoA synthesis is critical for dietary LCFA absorption; yet, the jejunal ACS enzymes that catalyze the reaction are largely unknown.

Findings: High throughput mRNA sequencing of the mouse jejunum revealed that the expression of acyl-CoA synthetase 5 (*Acs15*) and fatty-acid transport protein 4 (*Fatp4*) largely exceeded all other annotated ACS genes that activate LCFA. Interestingly, *Acs15* knockout (KO) mice displayed a decrease of 60% in jejunal total long chain acyl-CoA synthesis rate. Nevertheless, and despite of this decrease, dietary LCFA absorption and body-weight gain in response to high fat diet remained unaffected.

Conclusion: *Acs15* is a major activator of dietary LCFA, yet in *Acs15* KO mice residual ACS activity is sufficient for maintaining a normal LCFA absorption. Our findings provide further evidence for a robust small intestine LCFA absorption capacity.

Findings

Background

Intestinal absorption of dietary long chain fatty acids (LCFA) is an important determinant of body weight and obesity-related metabolic disorders. LCFA absorption largely occurs in the jejunum where these nutrients undergo uptake across the brush border membrane of enterocytes. LCFA uptake is followed by a critical activation step through conjugation with coenzyme-A (CoA). In enterocytes, dietary LCFA-CoA conjugates are primarily utilized for triglycerides (TG) synthesis, packed into chylomicrons and secreted through the basolateral membrane [1,2]. LCFA conjugation with CoA is catalyzed by Acyl-CoA synthetases (ACS). Mammals possess 13 annotated ACS genes that activate LCFA and clustered in three different gene families: ACSL (acyl-CoA synthetase long chain),

ACSBG (acyl-CoA synthetase bubblegum) and FATP (fatty acid transport proteins; also designated ACSVL or SLC27) [3-5]. The impact of each of these genes on intestinal absorption of LCFA is largely unknown.

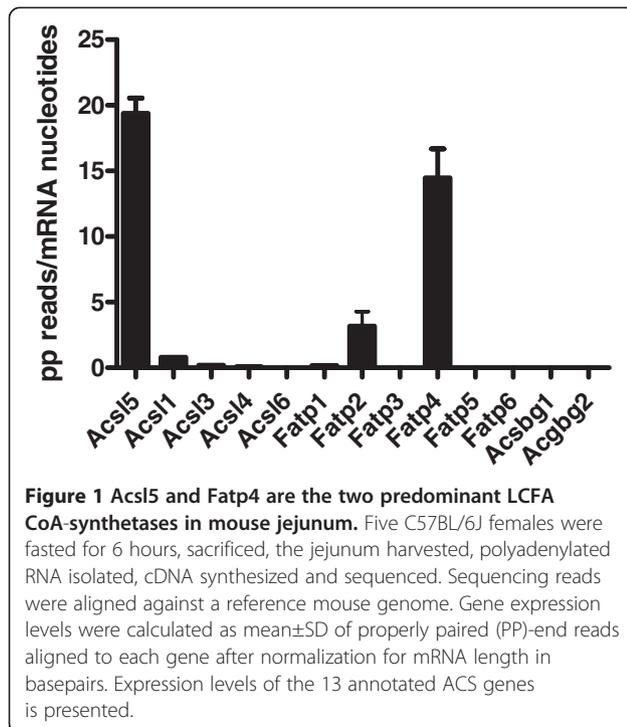

Methods

The methods used are described briefly at the figure legends. Detailed description of mice, diets and assays used in the study is presented in Additional files 1 and 2. All experiments involving mice were approved by the Cleveland Clinic Animal Care and Use Committee.

Results

Expression of long chain acyl-CoA synthetase genes in C57BL/6J jejunum was determined by transcriptome shotgun sequencing analysis (mRNA-seq). As shown in Figure 1, out of the 13 annotated LCFA acyl-CoA synthetase genes, the number of properly paired reads that were aligned to *Acs15* and *Fatp4* largely exceeded the number of reads that were aligned to the other genes. A previous study has shown that *Fatp4* is

dispensable for dietary fat absorption [6], therefore, we focused our efforts on elucidating the role of *Acsl5*. Quantitative PCR and Western blotting demonstrated that *Acsl5* is preferentially expressed in the jejunum (Additional file 3). These results suggested a role for *Acsl5* in determining the jejunal absorption of LCFA.

To determine the role of *Acsl5* in jejunal LCFA-CoA synthesis and absorption, we have used mice that were targeted for this gene (characterization of targeted animals is found in Additional file 2). Jejunum mucosal homogenates were assayed for acyl-CoA synthesis rate by using palmitic acid, a prototype member of the long chain fatty acid family, as a substrate. As shown in Figure 2A, as compared to wild-type littermate controls, *Acsl5*-KO males and females displayed a decrease of 60% in jejunal palmitoyl-CoA synthesis rate. Animals heterozygous for the targeted allele displayed only a moderate 15-35% decrease in activity, which reached statistical significance only in females. When compared to the jejunum, liver *Acsl5* expression is diminished (Additional file 3). Consistent with these findings, liver synthesis rates of palmitoyl-CoA in *Acsl5* KO mice were fully conserved (Figure 2B).

To determine the effect of *Acsl5* targeting on LCFA absorption, mice were fasted overnight, lipases activity inhibited through intravenous injection of tyloxapol, animals provided with a gastric bolus of olive oil supplemented with [³H]-radiolabeled oleic acid, and levels of

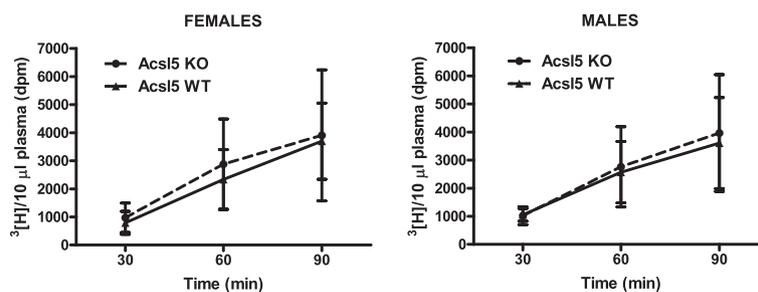

Figure 3 *Acsl5* KO mice display a normal dietary LCFA absorption from the intestine. *Acsl5* WT and KO mice, females or males, (5 per group), were fasted overnight and then intravenously injected with tyloxapol to inhibit vascular lipases. Thirty minutes later the mice received a gastric bolus olive oil supplemented with radiolabeled oleic acid and retroorbital sinus blood samples were collected at 30, 60 and 90 min post gavage. Plasma radioactivity was determined by scintillation counting.

the radioactive tracer were measured in plasma samples collected for the first 90 minutes post gastric gavage. As shown in Figure 3, as compared to littermate wild-type controls, *Acsl5*-KO males and females displayed undistinguishable plasma accumulation of the radiolabeled tracer. These findings suggested that targeting of the *Acsl5* gene has no impact on intestinal LCFA absorption.

To determine the effect of *Acsl5* targeting on body-weight gain in response to high fat diet, mice were fed a Western-type diet for 13 weeks. As shown in Figure 4, *Acsl5*-KO males and females displayed weight gain that was indistinguishable of their littermate wild-type controls. Finally, targeting of *Acsl5* had no effect on dietary cholesterol absorption, plasma cholesterol levels, plasma triglycerides or fasting plasma glucose levels (data not shown).

Discussion

We identified *Acsl5* as a major ACS gene expressed in the jejunum (Figure 1). Interestingly, while *Acsl5* targeting resulted in a substantial decrease in jejunal total LCFA ACS activity (Figure 2) this decrease was not sufficient to reduce either LCFA absorption or body weight gain in response to high fat diet (Figures 3 and 4). As expression levels of other ACS genes in the jejunum remained stable

(Additional file 2), these findings are consistent with a large capacity of the small intestine to absorb dietary LCFA. Therefore, even a reduction of 60% in total ACS activity is insufficient in affecting the absorption of LCFA even under conditions where the absorption process is stressed by the feeding of a high fat diet.

Our mRNA-Seq results suggest that jejunum *Acsl5* and *Fatp4* are expressed at a comparable level and together account for over 90% of the LCFA ACS transcripts in this tissue (Figure 1). A previous study reported, through targeting of *Fatp4*, that this enzyme is dispensable for intestinal fat absorption [6]. Unfortunately the authors have not reported the effect of *Fatp4* targeting on jejunal LCFA-CoA synthesis rate. Interestingly, studies in newly born *Fatp4*-KO mice demonstrated ~10 fold inhibition in activation of the very long FA lignoceric acid (C24:0) but no inhibition of the LCFA palmitic or oleic acids [7]. These findings may suggest that *Fatp4* is not a major determinant of LCFA absorption from the intestine. Nevertheless, studies in *Acsl5*/intestinal-*Fatp4* double KO, that are beyond the scope of this report, are needed to clarify the combined effect of *Acsl5* and *Fatp4*. It is of note that *Fatp2*, amongst the three highly-expressed LCFA ACS gene in the jejunum (Figure 1), may also contribute to LCFA absorption

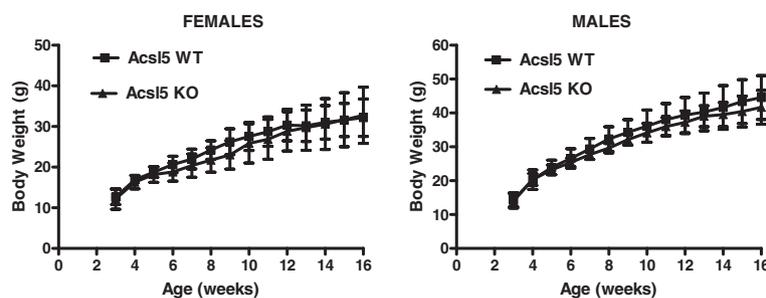

Figure 4 *Acsl5* KO display normal weight gain in response to high fat diet. *Acsl5* WT and KO mice, females or males, (5 per group), were fed a Western type diet for 13 weeks and body weights were recorded. No significant differences are observed between *Acsl5* KO and WT animals.

and the lack of phenotype in our *Acsl5* KO mice. Finally, we cannot exclude the possibility that additional, not as yet identified, ACS genes may contribute to absence of phenotype in *Acsl5* knockouts.
